AMENDMENTS TO THE CLAIMS:

- 1. (Previously Presented) A method for adding an acoustic description of a word to a speech recognition lexicon, the method comprising:
 - converting the text of the word into at least one orthographically derived acoustic description of the word;
 - generating a score for an orthographically derived acoustic description based in part on a comparison between the orthographically derived acoustic description and a speech signal representing a user's pronunciation of the word;
 - identifying a speech-based acoustic description of the word and a score for the speech-based acoustic description from the speech signal representing the user's pronunciation of the word , wherein the speech-based acoustic description is not associated with the text of the word; and
 - selecting one of the orthographically derived acoustic description and the speech-based acoustic description as the acoustic description of the word based on the score for the orthographically derived acoustic description and the score for the speech-based acoustic description.
- 2.(Original) The method of claim 1 wherein generating a score for an orthographically derived acoustic description comprises generating an acoustic model score.
- 3.(Previously Presented) The method of claim 2 wherein identifying a score for the speech-based acoustic description comprises generating an acoustic model score for at least one

speech-based acoustic description and using the score as at least part of the score for the speech-based acoustic description.

- 4. (Previously Presented) The method of claim 3 wherein generating an acoustic model score for the orthographically derived acoustic description and generating an acoustic model score for at least one speech-based acoustic description comprises using the same acoustic model to generate both acoustic model scores.
- 5. (Previously Presented) The method of claim 3 wherein identifying a score for the speech-based acoustic description further comprises generating a language model score for the at least one speech-based acoustic description and using the language model score as part of the score for the at least one speech-based acoustic description.
- 6. (Previously Presented) The method of claim 5 wherein generating an acoustic model score and generating a language model score for at least one speech-based acoustic description comprises generating an acoustic model score and a language model score for a sequence of syllable-like units and wherein the speech-based acoustic description is derived from the sequence of syllable-like units.
- 7. (Previously Presented) The method of claim 6 wherein deriving the speech-based acoustic description from the sequence of syllable-like units comprises dividing the sequence of syllable-like units into a sequence of phonemes.
- 8.(Original) The method of claim 6 wherein generating a language model score comprises generating a language model score based on a trigram language model for syllable-like units.

- 9.(Original) The method of claim 6 wherein generating an acoustic model score for a sequence of syllable-like units comprises generating acoustic model scores for each of a sequence of phonemes that form the sequence of syllable-like units.
- 10.(Original) The method of claim 1 further comprising displaying a user interface comprising an edit box in which a user may enter the text of the word and a list box that displays words for which an acoustic description has been previously added to the speech recognition lexicon.
- 11. (Original) The method of claim 10 further comprising:
 receiving an indication that a user has selected a word
 in the list box;
 - retrieving the added acoustic description of the word from the speech recognition lexicon; and
 - converting the retrieved acoustic description into an audible signal.
- 12. (Previously Presented) A computer-readable medium having computer-executable instructions for performing steps comprising:
 - receiving text of a word for which a phonetic description is to be added to a speech recognition lexicon;
 - receiving a representation of a speech signal produced by a person pronouncing the word;
 - converting the text of the word into a text-based phonetic description of the word;
 - generating a speech-based phonetic description of the word from the representation of the speech signal without using the text of the word; and
 - selecting a phonetic description of the word to add to the speech recognition lexicon by selecting

between the text-based phonetic description and the speech-based phonetic description based in part on the correspondence between each phonetic description and the representation of the speech signal.

- 13. (Original) The computer-readable medium of claim 12 wherein generating a speech-based phonetic description comprises:
 - generating a plurality of possible phonetic
 descriptions;
 - using at least one model to score each possible phonetic description; and
 - selecting the possible phonetic description with the highest score as the speech-based phonetic description.
- 14. (Original) The computer-readable medium of claim 13 wherein using at least one model comprises using an acoustic model and a language model.
- 15.(Original) The computer-readable medium of claim 14 wherein using a language model comprises using a language model that is based on syllable-like units.
- 16.(Original) The computer-readable medium of claim 15 wherein each syllable-like unit comprises a sequence of phonemes and wherein using an acoustic model to score a possible phonetic description comprises generating acoustic model scores for each of the phonemes in a syllable-like unit and summing the acoustic model scores of the phonemes to generate an acoustic model score for the syllable-like unit.
- 17. (Original) The computer-readable medium of claim 12 wherein:

- converting the text of the word into a text-based phonetic description further comprises generating a score for the text-based phonetic description based on the correspondence between the text-based phonetic description and the representation of the speech signal;
- generating a speech-based phonetic description further comprises generating a score for the speech-based phonetic description based on the correspondence between the speech-based phonetic description and the representation of the speech signal; and
- selecting between the text-based phonetic description and the speech-based phonetic description comprises selecting the phonetic description with the highest score.
- 18. (Previously Presented) The computer-readable medium of claim 12 wherein the steps further comprise:
 - receiving an instruction to generate an audible pronunciation of a phonetic description previously added to the speech recognition lexicon;
 - retrieving the added phonetic description from the speech recognition lexicon; and
 - causing an audible pronunciation to be generated based on the retrieved phonetic description.
- 19. (Cancelled)
- 20. (Cancelled)
- 21. (Cancelled)
